Installation 3

Installation

- The plugin runs on **ARM and Mipsel processors**. It is available as a **zip** or **ipk** file.

The **zip** file must first be unpacked. Then log in with an **FTP** program to the Vu+ (user: root, no password). Then copy the unzipped SmartEPGvu folder to the path [/usr/lib/enigma2/python/Plugins/Extensions](#).

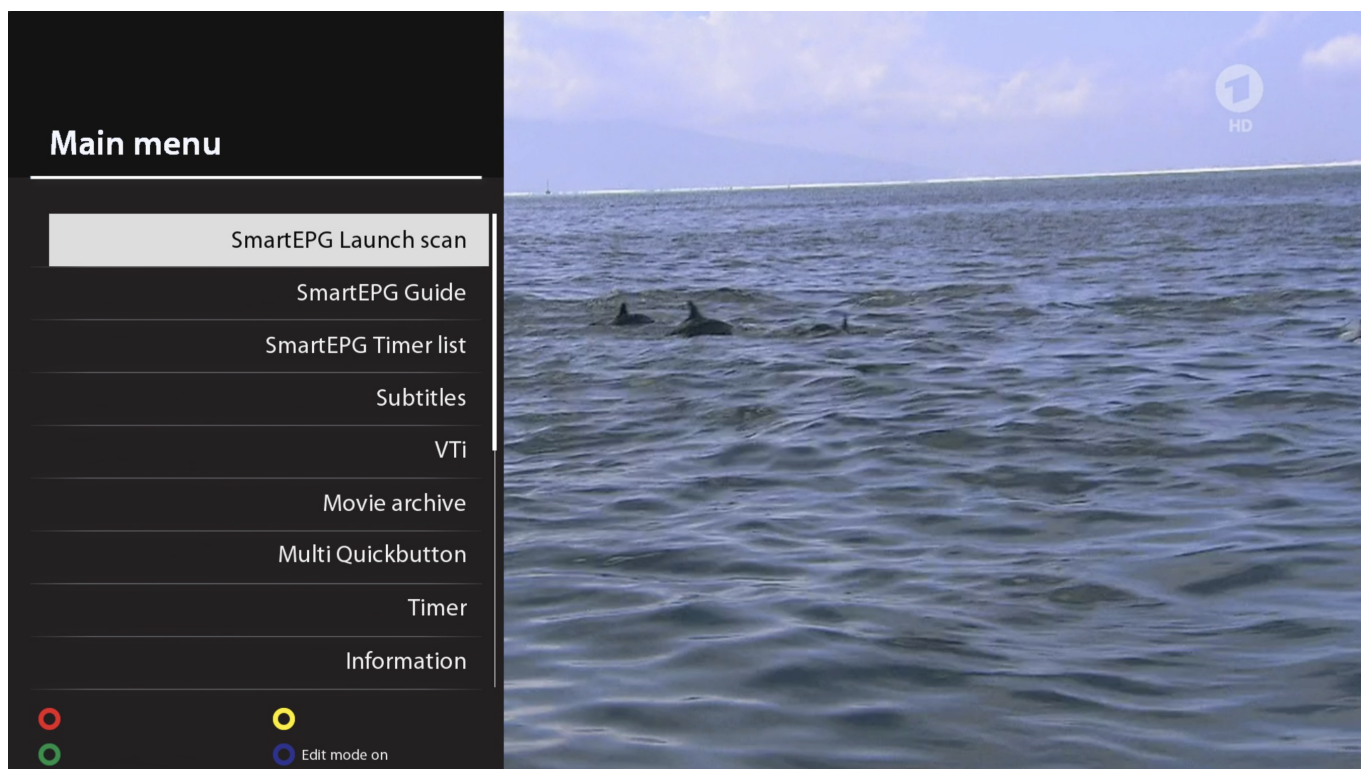

zip - always the latest version

- Alternatively, the plugin is also available as **ipk** and can then be installed e.g. using the Openwebif plugin in the browser on the Vu+:

ipk - always the latest version

After the installation, the GUI must be restarted and then three menu items for *SmartEPGvu*⁺ should appear in the main menu.

Start SmartEPG Scan

The channels selected in the *SmartEPGvu*⁺ menu are scanned, and the current EPG is loaded.

SmartEPG Guide

Calls up the [View 1](#) of *SmartEPGvu*⁺ which shows the EPG for a channel.

SmartEPG Timer List

Calls up the [View 5](#) of *SmartEPGvu*⁺ which displays all programmed timers.

The next step should be to configure the plugin via the [Menu](#).
